## **Eco Power Oil – Protect your vehicle and the environment**

Now there is a way keep your engine properly lubricated without using any more oil from the ground! That's right, no more need for crude oil from the ground. EcoPower oil is made from completely re-refined used motor oil; it actually ends up as a higher grade product than oil from new crude oil due to the additional refining processes.

- 🔧 EcoPower oil re-manufacturing uses up to 85% less energy than oil produced from crude
- 🔧 EcoPower conserves resources and reduces dependence on foreign crude
- 🔧 EcoPower is a Synthetic Blend to provide extra protection and performance
- 🔧 EcoPower is guaranteed and exceeds manufacturer's warranty requirements for vehicles requiring GF-4 API certified oil
- 🔧 EcoPower is used by the US Military and some of the largest truck and automotive fleets, including UPS, US Postal Service, where mission-critical performance is required. It is also installed in every new Mercedes Benz from the factory. Re-refined oil is even being used on the NASCAR circuit.
- 🔧 EcoPower reduces greenhouse gas emissions by more than 80% due to the reuse of reclaimed oil.

Used motor oil is, at times, contaminated with lead, arsenic, cadmium, chromium, PCB's and halogenated solvents. Dumping or spilling one gallon of used oil can pollute more than one million gallons of drinking water. Re-refining used oil into a reusable product can prevent damage to land, air, water, and health. Over 1.3 billion gallons of used oil are generated each year in the US, and 85 percent of that oil is burned for energy recovery. Once burned, used oil is destroyed and cannot be used again. Rather than using the oil once, re-refining extends the life of a non-renewable resource.

We are doing our part to help the environment and to make a better planet for the future. Would you like to join us in that commitment?
